

CALL CENTRE ANALYTICS DASHBOARD

Dashboard Interpretation Report | FY 2024

TNM PLC | Data Analyst Portfolio Project

1. Dashboard Overview

The Call Centre Analytics Dashboard for FY 2024 presents a consolidated view of TNM PLC's inbound call centre operations over twelve calendar months (January–December 2024). The dashboard is structured across five sheets: Raw_Data, KPI_Summary, Chart_Data, Agent_Performance, and the executive Dashboard view. Together, these sheets capture operational throughput, service quality, workforce productivity, and revenue attribution — providing leadership with the analytical foundation to drive performance improvement.

2. KPI Summary Cards — Annual Totals & Averages

KPI	FY 2024 Result	Industry Benchmark	Assessment
Total Calls Received	219,816	—	Strong inbound volume
Calls Answered	203,161	≥95%	92.4% answer rate — below benchmark
Calls Abandoned	16,655	—	
Avg Abandon Rate	7.59%	≤5%	Above acceptable threshold
Avg Handle Time (AHT)	264.8 sec	240–300s	Within normal range
First Call Resolution	76.4%	≥80%	Below benchmark; improvement needed
Avg CSAT Score	4.08 / 5.0	≥4.0	
Avg Speed of Answer (ASA)	58.5 sec	≤20–30s	Significantly above target
Avg SLA %	82.1%	≥80%	Meets target — marginal compliance
Avg Occupancy %	83.3%	80–85%	Within optimal range
Total Escalations	2,149	—	High; correlates with FCR gaps
Total Complaints	1,274	—	Requires formal tracking
Total Revenue (MWK)	137,043,469	—	Positive; revenue-FCR link evident

The KPI cards serve as the immediate health check of the call centre. The most critical signals are the 7.59% abandon rate — which exceeds the industry standard of 5% — and the 76.4% FCR, which falls short of the 80% benchmark. The ASA of 58.5 seconds is more than double the accepted norm, indicating customers are waiting too long before being served. On the positive side, the CSAT score of 4.08/5 and SLA compliance of 82.1% show the centre is functionally meeting its service commitments, though with limited headroom.

3. Monthly Trend Analysis

Month	Total Calls	Answered	Abandoned	Abandon %	AHT (s)	FCR %	CSAT	SLA %	Revenue (MWK)	Escalations
Jan-24	19,119	18,184	935	4.9%	304	73.5%	3.6	74.0%	9,779,635	103
Feb-24	18,965	18,167	798	4.2%	235	82.3%	4.3	82.3%	12,339,767	81

Month	Total Calls	Answered	Abandoned	Abandon %	AHT (s)	FCR %	CSAT	SLA %	Revenue (MWK)	Escalations
Mar-24	17,893	16,780	1,113	6.2%	237	87.1%	3.7	74.2%	12,513,525	147
Apr-24	18,696	17,762	934	5.0%	258	69.6%	3.7	85.3%	12,751,876	249
May-24	16,826	15,002	1,824	10.8%	320	70.0%	3.6	75.7%	11,850,221	148
Jun-24	17,200	15,778	1,422	8.3%	241	71.3%	3.8	87.7%	13,019,914	94
Jul-24	19,797	18,506	1,291	6.5%	244	69.3%	4.7	76.9%	9,285,794	244
Aug-24	17,071	16,052	1,019	6.0%	281	78.8%	4.4	80.3%	9,000,002	210
Sep-24	16,692	14,875	1,817	10.9%	229	80.5%	4.5	80.8%	13,840,931	215
Oct-24	20,025	17,715	2,310	11.5%	297	82.4%	4.3	89.7%	10,995,480	191
Nov-24	20,406	18,411	1,995	9.8%	302	73.3%	4.0	93.0%	11,849,336	295
Dec-24	17,126	15,929	1,197	7.0%	230	78.8%	4.4	85.8%	9,816,988	172
FY 2024 Avg	219,816*	203,161*	16,655*	7.59%	264.8	76.4%	4.08	82.1%	137,043,469*	2,149*

* Totals, not averages

3.1 Call Volume Trend

Call volume peaked in November (20,406) and October (20,025), with a secondary peak in July (19,797). These Q3 and Q4 surges reflect probable seasonal demand, product launch activity, or billing cycles. The lowest-volume months — May (16,826) and September (16,692) — still generated significant abandonment, revealing that low volume alone does not guarantee better service. The answer rate dipped to 89.1% in September, indicating that staffing was disproportionate to even moderate demand during that period.

3.2 Abandon Rate — Monthly View

The abandon rate shows three pronounced spikes: May (10.84%), September (10.89%), and October (11.54%). All three exceeded double the annual average. In October, 2,310 calls were abandoned — the highest single-month figure — occurring alongside the highest call volume (20,025). This combination points to an acute capacity shortfall. February recorded the lowest abandon rate (4.21%), suggesting either optimal staffing or lower complexity of calls that month. The correlation between ASA and abandon rate is strong: months with higher average speed of answer (e.g., January at 89 seconds) also showed elevated abandonment.

3.3 First Call Resolution (FCR) Trend

FCR fluctuated considerably — from a high of 87.1% in March to a low of 69.3% in July. Three months fell below the 70% mark (July at 69.3%, April at 69.6%, May at 70.0%), indicating that a meaningful proportion of customers required callbacks or repeat contacts. March's 87.1% FCR is a notable outlier; it coincided with moderate call volume (17,893) and the second-highest AHT (237 sec), suggesting agents invested more time per call to resolve issues fully. The negative correlation between FCR and escalations is evident: July's low FCR (69.3%) produced 244 escalations, the third-highest of the year.

3.4 CSAT Score Trend

Customer satisfaction scores were notably polarised. January (3.6), March (3.7), April (3.7), and May (3.6) represent a prolonged H1 dissatisfaction trend, suggesting systemic service issues in the first half of the year. Scores rebounded sharply from June onwards, peaking at 4.7 in July — the highest of the year — despite July also having the lowest FCR (69.3%). This paradox may reflect faster call handling or improved agent tone rather than issue resolution. The Q3 average CSAT of 4.53 was the strongest quarterly performance, and the Q4 average of 4.23 remained solid despite escalation pressure.

3.5 SLA Compliance Trend

SLA compliance averaged 82.1% for the year, narrowly above the typical 80% industry threshold. However, monthly performance was inconsistent. January (74.0%) and March (74.2%) fell materially below the target, and both months showed long ASA times (89 sec and 68 sec respectively). Conversely, November achieved 93.0% SLA compliance despite being the highest-volume month of the year — an anomaly that warrants investigation into whether temporary agents were deployed, queuing logic was modified, or a specific call type dominated with shorter handle times that month.

3.6 Monthly Revenue Trend

Total FY 2024 revenue was MWK 137,043,469. Monthly revenue ranged from MWK 9,000,002 (August) to MWK 13,840,931 (September). September's revenue leadership is striking: it had among the lowest call volumes (16,692) yet generated the most revenue, implying that call quality — particularly FCR (80.5%) and CSAT (4.5) — drove higher-value customer interactions. August recorded the lowest revenue despite a comparable call volume, with FCR at 78.8% and CSAT at 4.4 — pointing to call mix or upsell failure rather than service quality. Revenue dipped in July (MWK 9.29M) and August (MWK 9.0M) despite strong CSAT scores, suggesting revenue is more influenced by FCR and call purpose than customer satisfaction alone.

3.7 Escalations Trend

Escalations totalled 2,149 for the year, with a clear surge in H2. April (249) and November (295) were the two worst months. The April spike is notable because it occurred during a mid-volume month with a poor FCR (69.6%), suggesting agent skill gaps with a specific call type. November's 295 escalations — the annual peak — coincide with the highest call volume, lowest FCR outside the 69% cluster (73.3%), and the longest AHT (302 sec). February had the fewest escalations (81), supported by the best abandon rate and a solid FCR (82.3%). Escalation patterns serve as a leading indicator of FCR weakness and should be tracked in near-real-time.

4. Agent Performance Analysis

Twenty agents across four teams (A, B, C, D) were evaluated for FY 2024. Each agent was assessed on six primary dimensions — Calls Handled, FCR %, CSAT Score, AHT, Occupancy %, and Escalations — and classified into one of three performance tiers: Top Performer, Meets Target, and Needs Coaching.

Agent ID	Team	Calls Handled	FCR %	CSAT	AHT (s)	Occ %	Escal.	Complaints	Tier
ID 001	C	1,627	73.3%	4.2	238	72.5%	53	7	Meets Target
ID 002	D	1,584	78.6%	4.4	202	93.2%	36	14	Meets Target
ID 003	B	2,055	80.6%	4.6	275	89.7%	60	15	Top Performer
ID 004	A	1,745	83.1%	4.7	266	67.5%	50	35	Top Performer
ID 005	A	1,760	71.1%	3.1	322	65.2%	18	25	Needs Coaching
ID 006	B	1,746	78.2%	3.4	298	94.3%	27	10	Needs Coaching
ID 007	A	1,129	86.2%	3.9	225	93.3%	47	13	Meets Target
ID 008	B	1,024	60.8%	3.9	287	67.4%	32	7	Meets Target
ID 009	B	1,434	81.6%	3.8	214	80.7%	17	5	Meets Target
ID 010	A	1,707	69.0%	3.8	212	75.6%	49	32	Meets Target
ID 011	A	1,068	85.8%	4.4	218	83.2%	31	9	Meets Target
ID 012	C	1,043	65.0%	3.3	225	77.3%	18	37	Needs Coaching
ID 013	A	1,822	87.9%	4.7	210	90.7%	28	13	Top Performer
ID 014	C	1,826	70.1%	4.2	192	75.1%	29	27	Meets Target
ID 015	D	1,617	73.5%	4.6	316	67.8%	7	25	Top Performer
ID 016	C	1,709	68.1%	4.7	237	84.6%	24	8	Top Performer
ID 017	D	1,247	86.7%	4.4	243	76.5%	33	7	Meets Target
ID 018	D	1,662	93.7%	3.5	308	73.8%	48	22	Meets Target
ID 019	C	1,892	64.5%	4.8	290	91.4%	31	12	Top Performer
ID 020	D	1,576	83.7%	4.2	338	85.0%	33	14	Meets Target
Team Avg	—	1,563.65	77.1%	4.13	255.8	80.2%	671*	337*	—

* Team totals for Escalations and Complaints

4.1 Top Performers

Six agents were classified as Top Performers, distinguishing themselves through high FCR, strong CSAT scores, and sustained call volume. Key highlights include:

ID 013 (Team A) — FCR of 87.9% and CSAT of 4.7 make this agent the most balanced top performer, handling 1,822 calls with only 28 escalations. This agent demonstrates that high volume and high quality are simultaneously achievable.

ID 019 (Team C) — Highest call volume in the team (1,892 calls) with the highest CSAT score (4.8). Despite an FCR of only 64.5%, exceptional customer interactions suggest strong communication skills that compensate for resolution gaps.

ID 018 (Team D) — Remarkable FCR of 93.7% — the highest of any agent — indicating mastery of issue resolution. However, the lower CSAT (3.5) and high AHT (308 sec) suggest that while issues are resolved, the customer experience during those calls needs attention.

4.2 Agents Needing Coaching

Three agents were flagged for structured performance improvement:

ID 005 (Team A) — The lowest CSAT score in the team (3.1/5), paired with a high AHT of 322 seconds and a low occupancy rate of 65.2%, signals disengagement and inefficiency. With 25 complaints and an FCR of only 71.1%, this agent requires immediate coaching intervention across call quality and time management.

ID 012 (Team C) — The highest complaint count (37) combined with the second-lowest FCR (65.0%) and a CSAT of 3.3 indicate persistent customer dissatisfaction. This agent may benefit from additional product knowledge training and structured call scripting.

ID 006 (Team B) — A CSAT of 3.4 and AHT of 298 seconds suggest calls are lengthy without generating positive outcomes. The 94.3% occupancy rate, though high, could indicate the agent is overwhelmed rather than productive — a workload balance review is recommended alongside soft-skills coaching.

4.3 Performance Tier Distribution

Performance Tier	Agent Count	% of Team	Characteristics
Top Performer	6	30%	FCR ≥ 80%, CSAT ≥ 4.6 or high volume
Meets Target	11	55%	Average-to-good across key metrics
Needs Coaching	3	15%	FCR or CSAT below acceptable threshold

With 30% of agents classified as Top Performers and 55% meeting targets, the team has a competent core. The 15% needing coaching represent an addressable performance gap. If these three agents were brought to 'Meets Target' level, the team's aggregate FCR and CSAT would improve materially, with ripple effects on revenue and escalation rates.

5. Chart-by-Chart Dashboard Interpretation

5.1 Monthly Call Volume — Answered vs. Abandoned (Bar Chart)

This chart plots total monthly calls as stacked or grouped bars, with calls answered and calls abandoned as components. The chart immediately reveals the widening gap between answered and abandoned calls in May, September, and October, where abandonment breached 1,800 calls in a single month. The visual contrast between February's near-perfect answer rate (only 798 abandoned) and October's 2,310 abandoned calls quantifies the operational range the centre operated within. This chart is the primary tool for identifying capacity crisis months and informing headcount planning discussions.

5.2 Monthly SLA % Trend (Line Chart)

The SLA trend line exposes the compliance floor and ceiling across the year. The dip to 74.0% in January and 74.2% in March sits visually below any reasonable compliance threshold, while November's 93.0% peak demonstrates the upper boundary achievable with appropriate staffing. The line's irregular oscillation — with no sustained upward or downward trajectory — indicates that SLA management is reactive rather than proactively managed. A stable SLA line trending toward 90% would indicate systematic improvement in queue management and staffing allocation.

5.3 FCR % Trend (Line Chart)

The FCR line chart is one of the most diagnostically valuable visuals in the dashboard. It shows a pronounced trough in the July–August period following a strong H1 peak in March. The downward slope from March (87.1%) to July (69.3%) over four months suggests a gradual erosion in resolution quality — possibly caused by agent attrition, new product complexity, or insufficient knowledge base updates. The partial recovery in October (82.4%) shows the team can return to above-benchmark performance, making the Q3 dip more of an operational failure than a structural limitation.

5.4 CSAT Score Trend (Line Chart)

The CSAT trend line reveals a distinct H1/H2 split. The flat, low scores from January to May (averaging 3.64/5) contrast sharply with the rising scores from June to December (averaging 4.37/5). This shape — a prolonged plateau followed by a step-change improvement — typically indicates a discrete operational or training intervention occurred mid-year. The July spike to 4.7 merits specific attention: it coincides with the lowest FCR of the year, suggesting a structural change in how satisfaction was measured or that agents improved their interpersonal skills even while struggling to resolve issues on first contact.

5.5 Monthly Revenue (MWK) Bar Chart

The revenue chart provides a business-impact lens on the operational data. Three months stand out as revenue anchors: September (MWK 13.84M), June (MWK 13.02M), and April (MWK 12.75M). Notably, none of these are peak-volume months. The two lowest-revenue months — August (MWK 9.0M) and July (MWK 9.29M) — also experienced the highest H2 FCR failures, reinforcing the revenue-FCR linkage hypothesis. The dashboard's inclusion of revenue contextualises all other metrics: reducing FCR failure and abandon rate is not merely a service quality goal, but a direct revenue protection strategy.

5.6 Monthly Escalations (Bar or Line Chart)

The escalations chart flags supervision and complexity burden across the year. The staircase pattern — low in H1 (81–249 escalations) and elevated in H2 (172–295) — tracks the decline in FCR during the same period, confirming that unresolved first-contact issues flow upward to supervisors. November's 295 escalations alongside a 93% SLA rate is a telling combination: the centre was answering calls quickly but failing to resolve them, resulting in call re-entry and supervisory demand. Monitoring escalations as a real-time KPI can serve as an early warning system for FCR degradation.

5.7 Agent Performance Tier Distribution (Donut or Pie Chart)

This chart visually represents the composition of the 20-agent workforce by tier: 30% Top Performers (6 agents), 55% Meets Target (11 agents), and 15% Needs Coaching (3 agents). While the distribution appears healthy at first glance, the 15% coaching cohort disproportionately contributes to escalations and complaints — particularly ID 012 with 37 complaints, the highest individually. Moving even one agent from 'Needs Coaching' to 'Meets Target' can shift aggregate team metrics measurably.

5.8 Team-Level Comparison (Clustered Bar Chart)

Comparing Teams A, B, C, and D on FCR, CSAT, and Calls Handled reveals structural team differences. Team A has the widest performance variance — containing both top performers (ID 013: FCR 87.9%) and underperformers (ID 005: CSAT 3.1) — suggesting inconsistent team management or mentoring. Team D consistently achieves higher FCR rates, with ID 017 (86.7%), ID 018 (93.7%), and ID 020 (83.7%) all above 80%. Team C's CSAT distribution is interesting: ID 016 (CSAT 4.7) and ID 019 (CSAT 4.8) sit alongside ID 012 (CSAT 3.3), suggesting call assignment or specialisation could be used to protect customer experience scores.

6. Recommendations

1. Capacity Planning for Q3–Q4 Peaks

October–November call volume (20,000+ calls/month) with abandon rates exceeding 10% signals a recurring capacity gap. Scheduling temporary or flexible agents from September through November will reduce abandonment and relieve escalation pressure.

2. Investigate January & March SLA Failures

Both months recorded SLA below 75% — more than 7 percentage points below the annual average. A targeted root cause analysis should cover staffing, call routing configuration, and any system issues that may have extended ASA during these months.

3. Structured Coaching Plan for 3 Agents

ID 005, ID 006, and ID 012 collectively generated 72 complaints and have below-average FCR. A 60-day structured coaching plan — including call monitoring, scripting support, and product knowledge reinforcement — should be implemented with bi-weekly progress reviews.

4. FCR Improvement Initiative

Seven months fell below the 80% FCR benchmark. A knowledge base refresh, enhanced call scripting for top issue categories, and agent training on resolution techniques could lift FCR toward the 82–85% range, reducing repeat calls and escalations.

5. Leverage September's Revenue Formula

September achieved the highest revenue despite low volume, high FCR, and strong CSAT. A call-type and outcome analysis for September should identify which product interactions drove revenue, then replicate those conditions in structurally similar months.

6. Real-Time Escalation Monitoring

Escalations function as a leading indicator of FCR degradation. Introducing a real-time escalation dashboard for supervisors would allow immediate intervention before monthly metrics deteriorate — shifting management from reactive to proactive.

7. Peer Learning from Top Performers

Agents ID 013, ID 018, and ID 019 demonstrate best-in-class FCR and CSAT. A structured peer mentoring programme or recorded call review sessions would transfer these skills across the team, particularly to the Needs Coaching cohort.
